## Hypervalent iodane mediated reactions of N

This reaction is valid for preparation of primary amines only.

In contrast, multiple alkylation of ketones occurs because proton exchange generates the enolate of the alkylated product.

## Amine

In this section, we will explain the nucleophilic addition to carbonyl compounds, which is one of the most common chemical reactions of carbonyl compounds.

In other words, when tertiary amines react with a carbonyl compound, the synthetic reaction does not proceed. The reversal of selectivity is discussed on the basis of diastereofacial selection of the plausible iminium ion intermediates. Recent reports from Takazawa 88—90 provide the background for the reaction of enamines with aldehydes and acetals as well as with orthoesters in the presence of Lewis acids equations 22 89 and 23 90.

## Stereoselective Synthesis of Nitrogen

The formation of enamines during the Polonovski reaction is also favored by the presence of a base. The research will be carried out at Enamine Ltd in Ukraine, a global provider of chemical and biological services to biotech companies, academic institutions and research organisations. The intermediates formed in this process are called tetrahedral intermediates.
