In the literature, there are numerous different studies that focus on the development of tactile sensors ; ;. As a consequence, tactile materials and sensors are an essential element in effective robot grippers; however, to date, little effort has been invested in the optimization of these systems. Grasping operations require sensitive and dexterous manipulation ability.

These criteria are important not only for industrial but also for educational and experimental applications where the solution we propose can potentially deliver dramatic cost reductions, prevent waste, and generate meaningful time savings. Statistical analysis was performed with SPSS 20. These were a plastic sphere, an anti-static sponge rectangle prism, and a wood rectangle prism.

PeerJ Computer Science 7: e401 Robotic systems are generally used for grasping, carrying, holding, and many similar operations, typically in industrial applications. However, although its characteristics are almost linear, sensitivity decreases as thickness increases.

Not to mention raw material of these paint, coating materials with anti-bacteria, anti-virus effect is also made of petroleum now. So it is ideal to replace these raw materials with natural biomass based materials too.

Chemical analysis of resin

Each tactile material produced has its specific individual dimension and weight.

Thermal conductivity and anti

There was no dentin demineralization observed in both groups after water aging. Two different material types have been fabricated, namely are

epoxy resin-based A and Room Temperature Vulcanization RTV2 silicone-based B. According to different types of applications, researchers can choose the most effective approach for their particular research.
