## Chapter 6

Sulfur values were used to calculate potential acidity PA for CCPW and FCPW with respective values of 120. The slag beds were found to contribute large amounts of alkalinity. Chemical properties of coal waste The geochemical evaluation of CCPW, FCPW, and agricultural limestone included: 1 acid-base accounting, 2 determination of major and key trace elements in high temperature ash HTA product, and 3 x-ray fluorescence XRF analysis of all materials.

### Management of coal processing wastes: studies on an alternate technology for control of sulfate and chloride discharge

In humid and temperate climates with a positive water balance, flooding of underground and open pit operations will typically occur after closure. Reducing the rate of surface infiltration may be required. Chapter 14 - Special Handling Techniques in the Prevention of Acid Mine Drainage.

### Acid mine drainage from coal mining in the United States

The Successful Reclamation of Acid Generating Tailings in the Elliot Lake Uranium District of Canada: A Good-News Case, In Proc.

## Chapter 6

Mine Environment Neutral Drainage Program MEND , 2001. The cost of the process may be offset by the production of a relatively clean tailings material that can potentially be used to provide a final cover layer, rather than having to mine or import material from elsewhere.
