The incisions should be kept open by inserting a small chip of wood or toothpick to prevent the cut from healing over. A mixture of equal volumes of peat moss and coarse perlite is a suitable rooting medium for most plants, but combinations of other materials such as shredded peat, vermiculite, sand, and coir are also satisfactory. Hoops or stakes should be used to prevent the plastic bag from laying on the cuttings or seedlings. Grafting success increased when scion diameter was slightly larger than rootstock diameter. In 2004, the cut surfaces of half of the scions were dipped in a 200 ppm solution of IBA.
