Immobile trace elements and Archean volcanic stratigraphy in the Timmins mining area, Ontario

Subsequently, during the Variscan transpressional phase, the E-W extensional faults were reactivated as inverse faults, affecting the volcanic sequence of mafic to felsic composition and the intermediate complex sedimentary unit. Approximately 15% of the gold from the Porcupine Camp has been hosted by Timiskaming Group rocks, making them the second most important host.

The facies architecture of a paleoproterozoic basaltic andesite synvolcanic intrusion, Flin Flon, Manitoba, Canada

Deformation of the Lemarchant likely occurred during the Penobscot orogeny 486—478 Ma.

Phil C. Thurston

Characterization of Pyrite from Gold Deposits 1991 University of Western Ontario Ph. Grade The measure of concentration of gold within mineralized rock. These include, but are not restricted to, mining, processing, metallurgical, infrastructure, economic, marketing, legal, environmental, social and governmental factors.

Evolution of the southern Abitibi greenstone belt based on U

Geology, Stratigraphy, Mineralogy, Geochemistry, Petrogenesis, and PGE-Cu-Ni- Mineralization in the River Valley Intrusion, Sudbury Area, Ontario, Canada 2004 Laurentian University M.
