What was Pangea?

South African Journal of Science 71: pp.
The upper Fox Hills consists of stacked, upward-fining, trough to planar cross-bedded sandstone bodies. The site actually consists of seven separate collections.

Fossils Through Geologic Time

This is coprolite-the feces of an ancient animal that has become fossilized.

Dig Up Dinosaurs at These Family

In 1994, the National Park Service and the Survey entered into a cooperative agreement to conduct an inventory and assessment of the paleontological resources of Theodore Roosevelt National Park. The rock layers themselves - like pages in a long and complicated history - record the events of the past, and buried within them are the remains of life - the plants.

Fossils Through Geologic Time

A well-preserved coprolite might contain fossilized bones or plants that the animal ate which helps paleontologists to know what species co-existed with the animal that produced the feces.

Section 4: The Paleontology Laboratory

Two laws were passed in 1989 that have greatly enhanced the North Dakota Geological Survey's ability to manage the State's paleontological resources.

**Geology of the Fox Hills Formation (late Cretaceous) in the Williston Basin of North Dakota, with reference to uranium potential.
Report of investigation No. 55 (Technical Report)**

Some resembled newts and salamanders, while others bore a resemblance to snakes or eels. At the beginning of the age of dinosaurs during the Triassic Period, about 230 million years ago, the continents were arranged together as a single supercontinent called Pangea. Other authors are his advisor David Burnham, Klaudia Kuiper professor of geochronology focusing on chronology of the late Cretaceous, Phillip Manning professor of natural sciences, specialist in soft tissue scanning, Anton Oleinik associate professor geosciences, specializing in Cenozoic periods of change and, paleontologist and fossil collector, Florentin Maurrasse professor specializing in stratigraphy and biostratigraphy, and the K-Pg boundary in the, Johan Vellekoop postdoctoral researcher, published on microfossil record of the Chicxulub impactor, Mark Richards professor earth and planetary sciences, focus on earth crust tectonic and dynamic processes, and Loren Gurche a colleague at the Palm Beach Museum of Natural History.
