Rehabilitation of Motor Function after Stroke: A Multiple Systematic Review Focused on Techniques to Stimulate Upper Extremity Recovery

General discussion This review focused on rehabilitation techniques stimulating motor recovery of the upper extremity after stroke. Technology supported training For many health professionals working in stroke rehabilitation, the future lies within the development of technology-supported training for upper extremity recovery. The team analyzed pre-existing data from 74 individuals with MS to evaluate the contribution of various cognitive factors to verbal fluency, including language ability, oral-motor speed, processing speed, and executive functions.

Multiple Sclerosis Clinical Trials

Medical cannabis patients either matched or outperformed both the normative data set and the Canadian UG students test results at 30 min and 150—180 min post-THC ingestion, showing no evidence of neurocognitive impairment following THC consumption.

Associations between cognitive impairment at onset and disability accrual in young people with multiple sclerosis

Priming sensorimotor cortex to enhance task-specific training after subcortical stroke. Predictor variables include age, sex, lesion site, initial motor impairment, motor-evoked potentials, and somatosensory-evoked potentials.

Frontiers

For general inquiries, please use our. Multidisciplinary rehabilitation following botulinum toxin and other focal intramuscular treatment for post-stroke spasticity.

Verbal fluency deficits in multiple sclerosis may reflect impaired language ability

Updated January 13, 2021 Self-help services may not be permitted in all states.

Recovery

In humans, low-frequency rTMS inhibitory stimulation to the unaffected hemisphere could normalize the inhibitory imbalance between hemispheres Adeyemo et al. The remaining study found a decrease in performance at 60-min, immediately after first inhalation session , and 180-min, immediately after the second inhalation session , in both the low dose and high dose THC groups compared to placebo, although there was no difference between placebo and either THC group 1 h after each dosing session.

Cognitive impairment and its relation with disease measures in mildly disabled patients with relapsing

Treatment effects have been described in chronic stroke patients.

Cognitive impairment and its relation with disease measures in mildly disabled patients with relapsing

Stretching supplementary table For years, the prevention of range of joint motion loss, notably due to spasticity, has led to the application of arm stretch positioning during regular physiotherapy Ada and Canning,. Conflict of Interest CM has received support for industry sponsored continuing medical education from Canopy, Medreleaf, Doja, Compass Cannabis Clinics.
