## 71400893

This first published genome of a basal hemimetabolous insect, provides an out-group for comparison with other sequenced insects, and paves the way to elucidate molecular mechanisms in Negative selection prevents the fixation of deleterious alleles. We believe that it is at the intersection between Experimentation and Computation that the Biology of the XXIst century will be edified, and at the program we have our own experimental laboratory. Thus, although some deleterious alleles can segregate in the population, conventional wisdom holds that deleterious mutations are evolutionary dead ends.

### Bioinformatics and Genomics @ CRG

A review article detailing and contrasting different theories on the evolution of gene duplications has been in Nature Reviews Genetics.

## 71400893

The Groups at CRG's Bioinformatics and Genomics Program have strong collaborations with the CRG's Bioinformatics core and with other experimental groups at the CRG. We have launched MetaPhOrs, a meta-method to predict orthology and paralogy from multiple phylogenetic evidence. .

## 71400893

It contains phylomes from model Human, Yeast, Drosophila, Arabidopsis , but also alternative models such as the fungal pathogen Candida albicans, or the insects T.

## 71400893

In addition we built maximum likelihood trees for orthologous gene families in OrthoMCL, COG, and EggNOG. We use existing tools, but we also design and implement novel computational tools and databases, and we are also interested in basic research in algorithms. .

## 71400893

In this article we present the modern state of the theory of duplicated genes and provide concrete recommendations for future experiments that may do a better job at elucidating the selective mechanisms at work in the evolution of duplicated genes. Focus is on Genomics and Evolution.
