In 2020, in response to a Trump administration effort to reduce protections to the Sagebrush Sea and its wild inhabitants, a number of prominent scientists wrote a letter to the Bureau of Land Management BLM. This vicious cycle means that the sagebrush that manages to live alongside cheatgrass are at jeopardy. And climate change is and wildfire season, as it continues to make water irregular in the west.

Today, they must contend with wells and pipelines tapping the resources buried deep below. Most of the roots of this grass exist in the top 6 inches of the soil, and it lacks deeper roots needed to grow longer into the summer. Among those that have adapted to survive here are the Greater Sage-Grouse.

The Sagebrush Sea: Food Web

There are numerous natural history films on high-profile ecosystems like rainforest and tundra but strangely, sagebrush has been largely overlooked as an empty ecosystem located between lush and beautiful mountain ranges. For weeks, they practice their elaborate display and square off with other arriving males, battling to establish dominance and territory. When perennial bunchgrasses are lost from sagebrush steppe plant communities, invasives often fill the available sites, the number of natives decreases, and the community shifts to a new state: one dominated by annual grasses.
