

Pleistocene stratigraphy of Missouri River Valley along the Kansas-Missouri border.

-- Evidence investigated that led to the Missouri River drainage basin landform origins research project

Description: -

- Education -- Abstracts.
- Canada -- Emigration and immigration.
- Population forecasting -- Canada.
- Statistics -- Graphic methods.
- Business -- Graphic methods.
- Schneller, Ernst, 1890-1944.
- Werner, Friedrich Ludwig Zacharias, 1768-1823.
- Glacial epoch -- Missouri.
- Glacial epoch -- Kansas.
- Geology, Stratigraphic -- Pleistocene.Pleistocene stratigraphy of Missouri River Valley along the Kansas-Missouri border.

Up until the time of the flood flow reversals large melt water floods from Midcontinent River emerged from the Midcontinent River mouth along the decaying ice sheet margin in south central South Dakota and first flowed in a south direction across eastern Nebraska before headward erosion of the deeper Missouri River valley captured the flood flow note how the Missouri River valley downstream from Yankton, South Dakota is much wider than upstream.

Chapter 28

The larger sand-hill areas are on the table-land north of the valley of Platte River. For many years I have pursued a research interest that developed when as result of geologic field work and interpretation of large mosaics of detailed North American topographic maps I discovered significant evidence previous investigators had ignored. On the southwest side of the basin the northeast flank of Cold Spring Mountain the pediment that is preserved today as the aforementioned berm was forming at that time also, graded to the floor of Vermillion Creek basin.

Dissected Till Plains

Section in vicinity of Funnel Rock, 1 mile north of Ashford, Nebr. Along the north side of the Platte Valley, the south side of the Pumpkinseed Valley, and in portions of the ridge between these two valleys the Arikaree formation appears to lie directly on the Brule clay. A 2010 report assessed the roles of sediment in the Missouri River, evaluating current habitat restoration strategies and alternative ways to manage sediment.

Alluvial Plains

The slope of the pediment, moreover, is wrong for drainage into Irish Canyon. Along the south side of this butte the basal member of the Gering formation is, in places, not clearly separable.

Origin of Little Missouri River

The major ungulates were bison and elk, which have been extirpated; white-tailed deer and cattle are prevalent today. The maps made by Lewis and Clark, especially those of the region, provided a foundation for future explorers and emigrants.

Pleistocene stratigraphy of Missouri River Valley along the Kansas

The large bison population of the region gave rise to the term, an area of rich annual grasslands that extended from Mexico along the eastern flank of the Continental Divide.

Analysis of Mountains Passes along the East

On the slopes north of Platte River the formation appears to be absent except in a small area near the southwest corner of Sioux County, where the features shown in fig.

Analysis of Mountains Passes along the East

The Dakota sandstone underlies nearly all of Nebraska, and outcrops in a narrow belt extending from Missouri River to the vicinity of the ninety-seventh meridian.
