BAL was developed during World War II because of concern that lewisite, a toxic dichlorovinyl arsenic- containing vesicant, would be used as a chemical weapon. The sensitivity of measurements of hair elements is generally lower because of the need to first dilute and digest specimens in solution.

Treatment of mercury and lead poisonings with dimercaptosuccinic acid DMSA and sodium dimercaptopropanesulfonate DMPS. If hair analysis is used, results are best confirmed by provocative urine testing before a course of therapy is undertaken.

The intravenous route should be reserved for those patients with a compromised cardiovascular or GI status GI erosions that would impair oral absorption. Treatment with the thiols and vitamins restored the levels of these elements in certain tissues towards normal, but their concentrations remained abnormal in most instances.

## **Chelation Therapy**

Presented at the fifth Nordic Symposium on Trace Elements in Human Health and Disease, Loen, Norway, June 19-20, 1994. If urinary concentrations of arsenic remain elevated, prolonged therapy may be necessary. Heavy metals also alter the confirmation of protein and DNA and inhibit their function.

## **Chelation Therapy**

If urine is more dilute, creatinine is more dilute. In my practice the cut-off point for toxicity is set at 1. For example, cases of renal failure after use of an alternative cancer remedy 32 and ingestion of an aromatic therapy mixture 33 purchased via the Internet were reported.
