### Frontiers

Carbamazepine, phenytoin and phenobarbitone induce the liver P450 cytochrome enzyme system and stimulate steroid clearance.

### The effects of anti

**Discussion** To evaluate the evidence for efficacy of anticonvulsant medications in psychiatric disorders of childhood, we conducted a systematic qualitative review of relevant published RCTs. It is hoped that better understanding of the comparative actions of lithium, carbamazepine, and valproate will allow better targeting of individual drugs for individual patients as well as, ultimately, the development of new and more selective treatments for the recurrent affective disorders.

### Affective spectrum

Individuals with a major depressive episode or major depressive disorder are at increased risk for. Geller B, Luby JL, Joshi P, Wagner KD, Emslie G, Walkup JT, et al.

### Affective spectrum

It should also be pointed out that there are several psychiatric medications, such as antidepressants and benzodiazepines, whose efficacy has been shown in adults but not in children. When lithium is not discontinued, the increased morbidity during lithium withdrawal also would not occur and would not confound the evaluation of the new agent.

### The effects of anti

Identical twins have exactly the same genetic code.

### Affective spectrum

Journal of Clinical Psychopharmacology, 7, 401—405.

## **[Anticonvulsants (carbamazepine, valproate, lamotrigine) in bipolar affective disorder]**

Major depressive disorder MDD also underwent a notable change, in that the bereavement clause has been removed. Of these 355 publications, 331 were excluded as not meeting the pre-specified selection criteria, being 9 not in English, 11 not on anticonvulsants, 136 not for psychiatric use, 162 not RCT, 2 with too small of a sample size, and 11 secondary analyses of RCT see Figure. Based on the current data, the psychiatric use of anticonvulsants in children cannot be supported according to evidence-based standards.

### **Frontiers**

It would appear that some formulation that coordinates lateralized cortical function with the influence of ascending monoaminergic systems is required. Furthermore, carbamazepine increases hormone clearance and can negate the actions of the contraceptive pill, especially low oestrogen formulations.
