**Pulmonary edema**

At birth the lungs are very undeveloped with only around one sixth of the alveoli of the adult lung present. The lungs have a dual blood supply provided by a and a. Type II are larger and they line the alveoli and produce and secrete epithelial lining fluid, and.

### Pulmonary edema

Once in the lungs, oxygen is moved into the bloodstream and carried through your body. Breathing out requires no effort from your body unless you have a lung disease or are doing physical activity. But sometimes, the alveoli fill with fluid instead of air, preventing oxygen from being absorbed into your bloodstream.

### How Lungs Work

Nerve supply The lungs are supplied by nerves of the. The lungs are involved in the blood's by expelling when breathing.

### How the Lungs Work

Deakin PJ illust 5th ed. Air then travels continuously from the air sacs at the back, through the lungs, which are relatively fixed in size, to the air sacs at the front.

### Lung

This can disrupt the normal physiology of the lung and predispose to respiratory diseases. Principles of pulmonary medicine Seventh ed. There is a problem with information submitted for this request.
