Diversity and Abundance of Litter Frogs in a Montane Forest of Southeastern Brazil: Seasonal and Altitudinal Changes on JSTOR

We suggest that sea-level changes have an important role in shaping composition of anuran species on coastal communities. We also present notes on the natural history and habitat usage by the anurans.

These tiny frogs don't breed until four years of age, and hibernate during winters. In this category we have species including *Rhinella ornata*, *Dendropsophus cf.* Numbers on the bars indicate the actual number of species, and numbers in parentheses represent the area of the islands in ha.

Larger islands are usually more diverse in habitats than are smaller ones. Similarly, bromeliads are another potential breeding habitat used by anurans on all islands and, with the exception of Ilha de Jaguanum. The analyses were carried out using the R environment version 2.

In general, species richness tends to increase with increasing island area, which can affect both population size and diversity of habitats. They sit on vegetation above the ground in bromeliads. Second, instead of getting its toxins from its prey, it actually.

We are thankful to him for assigning our field trips with the military base Commander. Almeida-Gomes et al point out how vulnerable these species are because of their high habitat specificity so that disturbances such as removal of riparian forest and pollution could lead to their immediate disappearance.
