

# Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

Unesco - Quantifying the Detrimental Impacts of Land

Description: -

-Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

-

A New Portway large print book  
MAB report series -- no.19Ecological effects of different land uses and management practices on temperate and mediterranean forest landscapes - final report.

Notes: Report of the meeting held at Unesco, Paris, 16-19 April 1974.

This edition was published in 1974

## Drought, Desertification ..: Sustainable Development Knowledge Platform

However, the technological development and deep socio-economic transformations that have occurred in Europe since the middle of the last century have brought a new wave of major changes, including the intensification of high-yield agricultural areas and progressive abandonment of marginal lands. Big game hunting activities mostly red deer Cervus elaphus and wild boar S. However, the ever increasing abstraction of the limited resources has stimulated further a strategic approach focusing mainly on saving water rather than developing new water resources, in order not only to? Manzoni S, Trofymow JA, Jackson RB, Porporato A 2010 Stoichiometric controls on carbon, nitrogen, and phosphorus dynamics in decomposing litter.

## Influence of Different Forest System Management Practices on Leaf Litter Decomposition Rates, Nutrient Dynamics and the Activity of Ligninolytic Enzymes: A Case Study from Central European Forests

Potential positive effects of thinning activities for energy wood relate to soil filtration properties and therewith to improved water quality Spain: economy group. Land within the PAs was masked out, i.

## Rewilding processes shape the use of Mediterranean landscapes by an avian top scavenger

Our understanding of the ecological effects of the continued intensification of this process in managed forests, both in Europe and elsewhere, is limited compared to the effects of intensification within other production systems, particularly agroecosystems, as the nature and scale of changes are more complex and difficult to quantify.

## Man and the biosphere: An amplified ecological vision

Moreover, some wild ungulates may escape wounded from hunting raids and die later. The results of these measures were impressive as water

consumption was reduced by a third. Furthermore, stakeholders highlight the need for further research about the importance of different assortments such as stumps and logging residues for biodiversity on as yet unused forest areas as well as about appropriate harvesting intensities Finland, Norway, Spain.

#### **Genetic effects of forest management practices: Global synthesis and perspectives**

Extinctions over the last 500 years have primarily been driven by human actions, with the last 50 years experiencing the most rapid and extensive ecosystem changes during any period of human activity.
