Conservation social science: Understanding and integrating human dimensions to improve conservation

This module provides fundamental knowledge which will provide support to research in the field of Nature Conservation.

Diversity Toolkit: A Guide to Discussing Identity, Power and Privilege

No Proximate independent variable Following the designation of the protected area, local users are given little chance to participate politically in the rules regarding the use of natural resources within its boundaries. Viewed from space, Earth offers few clues about the diversity of life forms that reside there. In contemporary readings in child psychology.

SESMAD

Food Webs and Bioaccumulation The energy we receive from food can be traced back to the sun.

Understanding Conservation

Conservation of mass and length occurs around age 7, conservation of weight around age 9, and conservation of volume around 11. On completion of this module students will be able to design and conduct under supervision a basic scientific research project using appropriate techniques. This activity helps to establish a basis of respect within the group, helping the participants take the first steps toward creating and maintaining a constructive discussion of social justice and equity.

Conservation (concept)

It is not important who 'wins'—what matters most is the quality of the argument itself. For example, studies show that kids need to be assessed both verbally and non-verbally, as assessing children solely in a verbal manner can lead test results indicating that a proportion of the children are unable to conserve, while in actuality some children are only able to answer conservation tasks correctly in a non-verbal manner.

What is Law of Conservation of Energy?

The child than can conserve will understand that they still both have the same amount of clay. This module will be presented online, and no study material will be posted for this module.
