Lacking that sense of control leads to anxiety and depression, conditions that are on the rise among young adults. Moms and dads may even arrive home late at night, when the children are already sleeping. DSC does not warrant its accuracy nor provide legal guidance to parents or guardians of potential home alone children.

Three Symptoms Latchkey Children Carry Through Life

Latchkey kids is the term sometimes given to children who carry the keys to their home around their neck or in their pocket.

In determining when children can be unsupervised, parents often consider age, emotional maturity, and competence of the child. The amount of unsupervised time children spent with peers predicted behavior problems at home and school as well as lower academic functioning.

Latchkey Kids: The Problem with Leaving Children Alone at Home

It is difficult to estimate how many children are being subjected to it. Positive effects of being a latchkey child include independence and at a young age. So, the findings of those studies must be interpreted cautiously.

None of her friends were there, either. It felt like what an adult might present at a cocktail party. The Child Development Project investigated

associations between self care during first grade and developmental outcomes in sixth grade.

The Weird After

Time spent in self care was associated with externalizing behavior problems for the children from lower but not middle income families. Alone, I would dress in costumes and act out expansive scenes in my upstairs hallway. The evidence indicates that self care is used for part of the after-school hours either regularly or on occasion by far more than 12 percent of families with elementary school children.
