Code division multiple access communication system and method using ternary phase shift keying

Reverse global channels are also controlled by the APC algorithm to maintain sufficient signal power to interference noise power ratio SIR on those reverse channels, and to stabilize and minimize system output power. Control modulation in multipoint-to-point communication using orthogonal frequency division multiplexing 1995-02-06 2009-02-10 Adc Telecommunications Inc. One skilled in the art would realize that the implementation of FF 203 will create a cumulative delay effect for the code sequences produced at each FF stage in the chain.

Each stage of this delay line 872 holds the signal corresponding to a different multipath signal component. Ranging and round trip delay timing adjustment in a multi-point to point bidirectional communication system 1995-02-06 2009-06-16 Adc Telecommunications, Inc.

What is CDMA and How Does it Work?

The Broadcast Modem provides the broadcast information used by the exemplary system, and the broadcast message data is transferred from the MIU controller 1230 to the System Modem 1210. Methods for multiframe alignment 1995-02-06 2011-02-01 Adc Telecommunications, Inc.

Considering the slope M of the error signal in the neighborhood of a lock point τ_0 : EQU20 where $w'(t)$, τ is the derivative of $w(t)$, τ with respect to t , and $g(t)$ is the average of $f(t)$.

code division multiple access communications

Optical Code Division Multiple Access Communication Networks — Theory and Applications introduces the code theory of OCDMA, the methods and technologies of OCDMA encoding and decoding, the theory and methods of analyzing OCDMA systems with various receiver models and realizing multiple-class services with different bit rates and QoS. REPRESENTATIVE DIGITAL DEMODULATOR The FFT subsystem 50 shown in FIG. DESCRIPTION OF THE RELEVANT ART Providing quality telecommunication services to user groups which are classified as remote, such as rural telephone systems and telephone systems in underdeveloped countries, has proved to be a challenge in recent

years.

CDMA

Additional details of this technique are described in U. Note that the time-shared subsystems are slightly more complex than the conventional non-time-shared versions.

Wireless Communication

A Z-search algorithm is used to speed the process on the assumption that the code phase has not drifted far from where it was the last time the system was locked. The dependent claims refer to advantageous embodiments of the invention. The MUX shown in FIG.
